Autonomy Strategic Challenge Achievements at Autonomous Warrior 2018

Helen Pongracic, Adella Bhaskara, James Brooks, Sandra Lambeth, Luke Marsh, Glenn Moy, Marcin Nowina-Krowicki, Ben Rice, Christopher Shanahan, Julian Vince, Steven Wark, Darren Williams, Michael Skinner

**Defence Human Sciences Symposium
19-20 November 2019**

Dr Michael Skinner (1956-2019)

Mike at Autonomous Warrior 2018

TTCP Autonomy Strategic Challenge

“Controlling different autonomous platforms like this is a game changer. Like getting lions, tigers and bears to hunt as one species.”
CMDR Paul Hornsby

Autonomy Strategic Challenge

- Mission
 - To enhance, demonstrate and evaluate the military utility of autonomous systems for future littoral operations
- Objectives
 - Determine the potential military utility of autonomy technologies
 - Advance and demonstrate human-autonomy teaming through simulation and live trials
 - Improve interoperability of emerging autonomous systems
 - Harness industry developments for military requirements

C2 Autonomy Technologies

UUV USV UAV
Maritime Autonomous Platform Expedition
MAPLE

UV-Combat System integration (MAPLE)

Effective & flexible human management of multiple simultaneous UV missions (IMPACT).

Policy management (COMPACT).

Authority Pathway.

Machine recommends multiple action 'plays' learned via online operator feedback.

Platform Autonomy Technologies

Unmanned Vehicle team coordination software
Unmanned Vehicle Mission Oriented Operating Suite (MOOS) integration

+ Industry Platform Autonomy Contributions

Allied IMPACT

MAPLE
Information Architecture

COMPACT
Policy Management & Negotiation

Narrative
Interactive News & Explanation

New Tech Explorations

- Cyber Displays
- Provenance Decision Origins
- Context-aided Speech Recognition

Authority Pathway
Effects Employment

IMPACT
Flexible Intelligent Multi-UxV C2

DARRT
Human-Autonomy Monitoring & Evaluation

Dynamic Tasking Module
Distributed Dynamic Plans

Recommender
Intelligent COA Analysis

Narrative

Multimedia Narration for naturalistic interaction and enhanced situation awareness

- Context and time sensitive
- Implementation:
 - Adaptive mission briefings for operators
 - Multimodal Q&A and notifications
 - Platform status reports on demand
 - Recommendation and plan explanation on demand
 - Provenance reporting on demand

1. Virtual Human Avatar

2. Geospatial Tile

3. Explanation Specific Application Tile

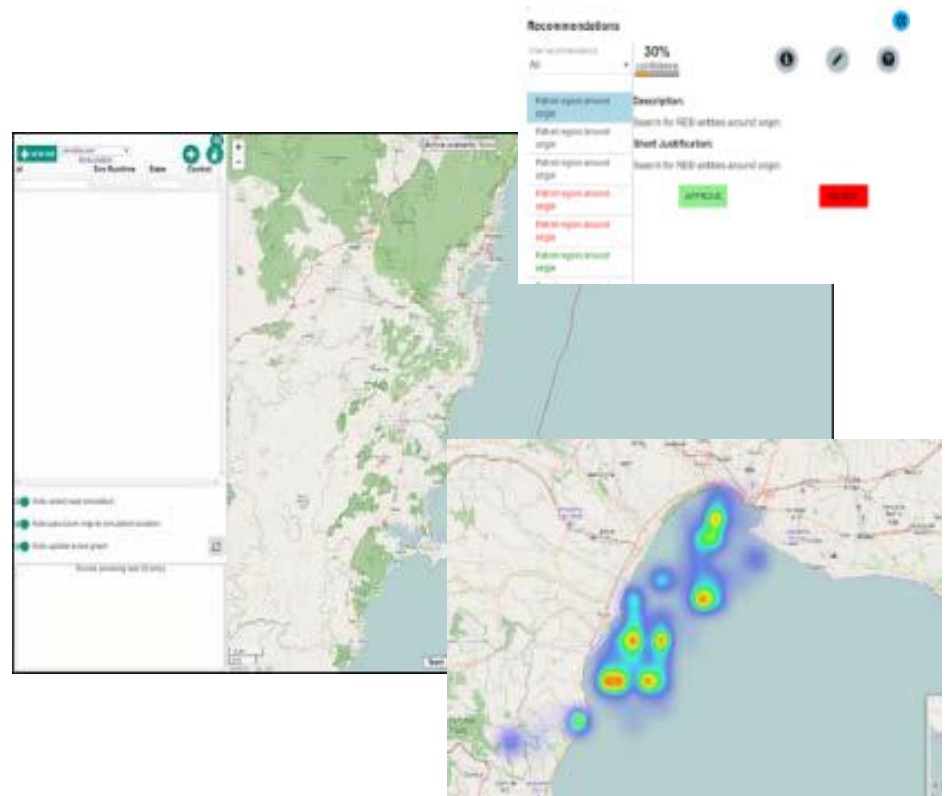

Recommender

Enhanced agent learning and modelling tool to identify areas with high probability of threat detection

- Uses Simulated Annealing, Evolutionary Algorithms, and Bayesian Learning techniques
- Based on available intelligence information and internal simulations of threat behaviour

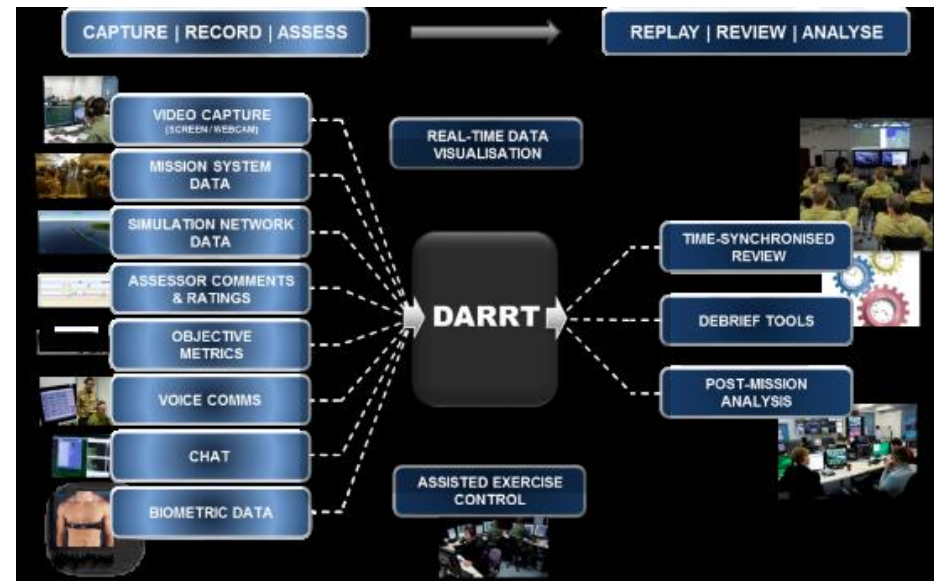

DARRT: DSTG Assessment & Review Research Tool

An assessment and review tool that supports real-time data analysis and rapid, focused after-action reviews

- Calculate, store, and display key mission performance metrics
- Present real-time status and mode of autonomous platforms
- Deliver multi-media after-action review of mission performance

Evaluation Metrics

TTCP-Autonomy Strategic-Challenge¹

Date: _____
SME ID: _____
Trial: _____

Below are a series of questions aimed at evaluating the military utility of the AIM suite of technologies in supporting the operator to achieve the required military functions of the mission. Please circle the response that best fits your opinion, and make comments where you wish to expand on your response or direct the attention of the researchers.

1-Overall-mission-execution¹
The overall mission was completed.
Unacceptably → → → Acceptably, but with concerns → → → Acceptably

Why? %
The AIM operator appeared: %
Not in control → → → Marginal in control → → → Fully in control
Why? %

2-Participate-in-wider-force-command-and-control¹
2.1 Mission-briefing-and-updates¹
Were the mission-briefing-and-updates successfully provided? Yes No X
Were the mission-briefing-and-updates concise-and-meaningful? %

Unacceptable: 1a Satisfactory: 2a Good: 3a Excellent: 4a
Comments: %

TTCP-Autonomy Strategic-Challenge¹

Date: _____
SME ID: _____
Trial: _____

1) Please indicate which response best matches your opinion of the POTENTIAL VALUE of the AIM concept for future (A) operations.

Comments: %

2) If implemented, how would the AIM concept impact manpower requirements for (A) operations?

Comments: %

3) If implemented, how would the AIM concept impact the training requirements associated with operating (A) systems?

Comments: %
Page Break: _____

TTCP-Autonomy Strategic-Challenge¹

Date: _____
SME ID: _____
Trial: _____

Now that you have had the opportunity to interact with the AIM system and observe others using the AIM system, please rate AIM across the different human-machine teaming heuristics.

Observability
HE-Question: Observability means the system proactively communicates with you to let you know what it's thinking and doing, and lets you know the state of its accomplishing your joint work. Example: your GPS (direction) app letting you that it's avoiding you because there's an accident ahead.
I rate this system's Observability as: High, Medium, Low (Circle one!)
What aspects of the system are observable? %

What aspects of the system should have greater observability? %

Predictability
HE-Question: Predictability means the system communicates with you about its' intentions, goals, and future actions in various contexts. Example: The green 'armed' light on an autopilot control panel informs the pilot when the approach glide path starts, so descent will automatically begin.
I rate this system's Predictability as: High, Medium, Low (Circle one!)
What aspects of the system offer good predictability? %

What are aspects for which you need greater predictability? %

Comments: %

TTCP-Autonomy Strategic-Challenge¹

Workload & Situation Awareness Assessment¹

1) Please rate your perceived overall workload for the mission. Use the attached table to assign attribution if you rate your workload above 3.

1a	2a	3a	4a	5a	Attributions
VERY LOW All tasks can be completed in a timely manner with significant capacity to respond to other events	LOW All mission critical tasks can be achieved with little spare capacity for other tasks	MODERATE All mission critical tasks can be achieved with acceptable spare capacity for other tasks	HIGH All mission critical tasks can be achieved with little spare capacity for other tasks	VERY HIGH Unable to complete mission critical tasks	
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

Comments: %

2) Please rate your perceived overall situation awareness for the mission. Use the attached table to assign attribution if you rate your situation awareness below 3.

1a	2a	3a	4a	5a	Attributions
VERY LOW Minimal knowledge of system state	LOW Fair knowledge of system state	MODERATE Full knowledge of system state	HIGH Full knowledge of system state	VERY HIGH Full knowledge of system state	
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

TTCP-Autonomy Strategic-Challenge¹

Mission Critical Decision Training Event	Probability	Remedy	Verifiability	Reversal	Observability	Prevalence
Description of Risk	Severe	Catastrophic	Severe	Major	Minor	Negligible
Mitigation						

TTCP-Autonomy Strategic-Challenge¹

Trust Assessment¹

Please rate your level of agreement with each of the following statements. Any additional comments are great!

Task Manager: Satisfactory

Overall, I think the system is trustworthy. %

The system is a competent performer. %

I can depend on the system. %

I find the system very predictable. %

I have faith that the system will perform well. %

The system is very responsible. %

Capstone Event

Team of **100+ scientists** from **5 nations** & **8 research labs** demonstrated and evaluated the military assessment of AIM

Evaluation

■ Live Trials

- 3 use cases: counter-smuggling, unit protection, base attack
- Experienced AIM operator at controls, 7 SMEs (AUS, UK, US, CAN) observe, comment and rate AIM system performance
- 6 trials

■ Synthetic Trials

- Use elements from all 3 live use cases, in simulated 1 hour trial (4 event types and 35 tasks)
- SMEs at the controls of the AIM system, collect objective/subjective performance data
- 7 trials

Metrics

■ Objective

- Number of assets managed by a single operator
- % mission completeness
- Response time (intruder events, commander queries)
- Commander query accuracy
- Number of plan monitor and/or COMPACT violations
- Weapon engagement accuracy

■ Subjective

- System usability scale
- Situation Awareness, Workload, Trust, Risks
- Military Utility
- Human-Autonomy Teaming heuristics (observability, predictability, directability, directing attention, adaptability, calibrated trust, common ground, information presentation, exploring the solution space)

High Level Accomplishments

- Improved interoperability of emerging TTCP autonomous systems
 - Full integration of 22 components developed by 14 organisations from all 5 TTCP countries
- Enabled a single operator to manage 17 unmanned assets (6 live inclusive of air, sea and ground platforms)
- Successfully used novel data logging capability for rapid, interactive after-action reviews

“The system is an absolute game changer as we advance towards Human-Machine Teaming” – SME 6

Results (1)

- Mission Performance
 - Mission Completeness – average > 92%
 - Response Time to Intruder Events – (100.5 → 28.3 secs)
 - Commander Queries
 - Response time (69 → 45 secs), accuracy >95%
- Workload and Situation Awareness
 - Workload associated with *time pressure* and *mental effort*
 - Acceptable level, with some shedding of lower value tasks.
 - SA – overall rated “high”
- Trust & HAT
 - Varied somewhat
 - Likely reflecting the immaturity of the system and/or SME understanding

“I always felt like I had good situational awareness and could easily figure out what my assets were doing at a given time” - SME 2

Results (2)

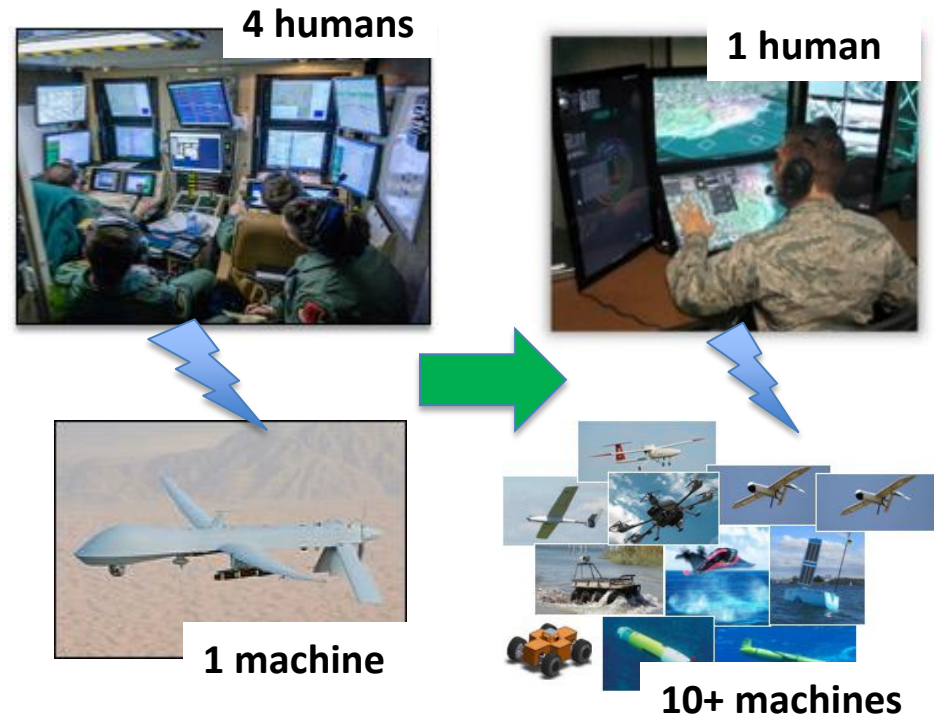

■ Military Utility

- 6/7 SMEs indicated the AIM concept had **“great value”** for future UxV operations
 - **“Amazing system! Truly needs to proliferate into current C-UxS systems as well as multi-domain C2. Solves missing autonomy piece for several efforts” – SME 7**
 - “This week has shown the systems is adaptable enough to meet different mission sets. More use to build proficiency and trust is required especially to learn the nuances of the system” – SME 2
- 6/7 SMEs: AIM concept could **decrease manpower requirements**
 - “Has the potential to reduce the number of operators needed” – SME 2
 - **“Potential for reducing manpower requirement is evident” – SME 1**
- 7/7 SMEs: AIM concept could **decrease operators’ response time** to new events
 - “AIM is able to create plays quicker than a human. This will significantly reduce response time” – SME 5

“The automation and cueing of events allows the operator to respond much faster” – SME 2

Outcomes demonstrated

- **Force Multiplication** by small teams of human operators controlling a large autonomous fleet in a dynamic threat environment
- **Interoperability architecture** to provide guidelines for industry innovation
- **Integration** of autonomous technologies between the 5 nations, for faster and more informed decisions, saving on national development costs
- **Enhanced Agility** by merging tactical and operational control for faster military decision cycles
